eXtplorer Version:	2.1.2	Joomla! Version: none
Description <p>I installed eXtplorer (2.1.3) in my local server under Windows and apache, and extplorer works fine. But I've installed in my Linux/Apache server and I can't delete o rename any unique file. I mean: if I select a file (just one file) the button for deleting o renaming is useless, I can't press them. But If I select two or more files I can press the button and delete them. Of course I can not rename them. It's not a problema of permissiions: I can edit, save, upload.. files. Permissions are OK. In FTP mode I can select and delete one file and of course rename it. There isn't any problem with permissions. Where is the bug? Where is the fix?</p> <p>But I have a very large site and I can't use FTP mode, the scripts consume all the time (more tan 45 sec) and system kill it. I use versión 2.1.3 as standalone.</p> <p>Thanks</p>
