| Description New install in Joomla 3.0.2 - two issues 1) Installer does not set Component Title property in database. Error - "Undefined property JAdministrator::\$JComponentTitle" 2) Windows for displaying file are out of the flow, covering the error-reporting area. Component's CSS needs to not be positioned absolute - allow error display to push windows down. Attempts to drag top edge of windows does not open up error area - resizes area above. See screenprint. | | |
